PUBLISHERS' NOTE ON THE COMPLETED WORK

WITH the publication of the Atlas which is incorporated in the present edition The Century Dictionary and Cyclopaedia has been brought to completion. As the Cyclopaedia of Names grew out of the Dictionary and supplemented it on its encyclopedic side, so the Atlas has grown out of the Cyclopaedia, and serves as an extension of its geographical material. Each of these works deals with a different part of the great field of words,—common words and names,—while the three, in their unity, constitute a work of reference which practically covers the whole of that field. The total number of words and names defined or otherwise described in the completed work is about 450,000.

The special features of each of these several parts of the book are described in the Prefaces which will be found in the first, ninth, and tenth volumes. It need only be said that the definitions of the common words of the language are for the most part stated encyclopedically, with a vast amount of technical, historical, and practical information in addition to an unrivaled wealth of purely philological material; that the same encyclopedic method is applied to proper names—names of persons, places, characters in fiction, books—in short, of everything to which a name is given; and that in the Atlas geographical names, and much besides, are exhibited with a completeness and serviceableness seldom equaled. Of The Century Dictionary and Cyclopaedia as a whole, therefore, it may be said that it is in its own field the most complete presentation of human knowledge—scientific, historical, and practical—that exists.

Moreover, the method of distributing this encyclopedic material under a large number of headings, which has been followed throughout, makes each item of this great store of information far more accessible than in works in which a different system is adopted.

The whole represents fifteen years of labor. The first edition of The Century Dictionary was completed in 1891, and that of The Century Cyclopaedia of Names in 1894. During the years that have elapsed since those dates each of these works has been subjected to repeated careful revisions, in order to include the latest information, and the results of this scrutiny are comprised in this edition.

 tube, duty: see Preface, pp. ix, x).
 ú as in pull, book, could.
 ü German ü, French u.

oi as in oil, joint, boy.
 ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā̇ as in prelate, courage, captain.
 ē̇ as in ablegate, episcopal.
 ô̇ as in abrogate, eulogy, democrat.
 ù̇ as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). See Preface, p. xi. Thus:

ā̈ as in errant, republican.
 ē̈ as in prudent, difference.
 î̈ as in charity, density.
 ö as in valor, actor, idiot.

ñ as in Persia, peninsula.
 ē̄ as in *the* book.
 ŷ as in nature, feature.

A mark (◡) under the consonants *t, d, s, z* indicates that they in like manner are variable to *ch, j, sh, zh*. Thus:

t̄ as in nature, adventure.
 d̄ as in arduous, education.
 s̄ as in pressure.
 z̄ as in seizure.

th as in thin.
 ꞥh as in then.
 çh as in German ach, Scotch loch.
 ñ French nasalizing n, as in ton, en.
 ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from*; i. e., derived from.
 > read *whence*; i. e., from which is derived.
 + read *and*; i. e., compounded with, or with suffix.
 = read *cognate with*; i. e., etymologically parallel with.

✓ read *root*.
 * read *theoretical or alleged*; i. e., theoretically assumed, or asserted but unverified, form.
 † read *obsolete*.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back¹ (bak), *n.* The posterior part, etc.
back¹ (bak), *a.* Lying or being behind, etc.
back¹ (bak), *v.* To furnish with a back, etc.
back¹ (bak), *adv.* Behind, etc.
back^{2†} (bak), *n.* The earlier form of *bat*².
back³ (bak), *n.* A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only § 5.
 Chapter only xiv.
 Canto only xiv.
 Book only iii.

Book and chapter }
 Part and chapter }
 Book and line }
 Book and page } iii. 10.
 Act and scene }
 Chapter and verse }
 No. and page }
 Volume and page II. 34.
 Volume and chapter IV. iv.
 Part, book, and chapter II. iv. 12.
 Part, canto, and stanza II. iv. 12.
 Chapter and section or ¶ vii. § or ¶ 3.
 Volume, part, and section or ¶ . I. i. § or ¶ 6.
 Book, chapter, and section or ¶ . I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discrimi-

nated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoölogical and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoölogy, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoölogical and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

The noun is prop. pronounced, as being of *ME.* origin, sem'ent (formerly, in the spelling *ciment*, sim'ent); but the pron. sē-ment', after the verb, is now more common.]

1. Any composition which at one temperature or one degree of moisture is plastic and at another is tenacious. Cements are used for uniting materials of the same kind or of different kinds, or for forming smooth and impervious surfaces or coatings. The term properly includes papier-maché, gums, glues, mucilages, limes, mortars, and a great number of compounds of such nature as to admit of their assuming, under certain conditions, sticky, tenacious, or stone-like consistency. Cements are divided into classes, according to their use, as *glass-cement*, etc. The materials forming the cement are mixed with water, acids, oils, etc., to a paste, and applied to the surfaces to be joined together or coated, and then dried; or, either wet or dry, are applied hot, or are applied and then heated, when they become hard and tenacious. This hardening is called the "setting" of the cement. The cements in use in the arts are exceedingly numerous, and are composed of a great variety of materials.

This hadden tiles for stoons, and towgh cley for symnt. *Wyclif*, Gen. xl. 3.

And knytte into oon til noon humoure be therin.
Palladius, *Husbandrie* (E. E. T. S.), p. 156.

Specifically—2. A kind of mortar which sets or hardens under water: hence often called *hydraulic cement*. It is, however, often used in superior masonwork not intended to be covered by water. There are two kinds of cement well known in Europe, *Portland* and *Roman*. *Portland cement* (named from its resemblance in color to Portland stone) is made from selected materials, commonly chalk and river-mud or alluvial clay. *Roman cement* (unknown to the Romans, but deriving its name from a supposed resemblance to Roman mortar) was originally made of volcanic ashes, but is now more often made from materials obtained from the Jurassic series of rocks. Much of the cement used in the United States is that known as *Rosendale*. See *cement-stone*.

3. A name sometimes given by placer and hydraulic miners to any rather firmly compacted mass of detrital auriferous material. Usually, however, the application of the word is limited to detrital material of volcanic origin, consisting of fragmentary substances mixed with ashes and caused to cohere somewhat firmly by pressure, or by silicious or calcareous matter.

4. In *anat.*, the cortical substance which forms the outer crust of a tooth from the point where the enamel terminates to the apex of the root, resembling bone in anatomical structure and chemical composition. Also called *cementum*. See *cut* under *tooth*.

As age advances, the *cement* increases in thickness, and gives rise to those horny growths, or exostoses, so common in the teeth of the aged.

H. Gray, *Anat.*

5. In *zoöl.*, a substance which cements or glues, as the secretion by which a barnacle adheres.

—6. Figuratively, bond of union; that which firmly unites persons or interests.

Sweet'ner of life! and solder of society.

Blair, *The Grave*, l. 83.

7. A compound made of pitch, brick-dust, plaster of Paris, etc., used by chasers and other artificers to put under their work that it may lie solid and firm, for the better receiving of the impression made by the punches and other tools. *E. Phillips*, 1706.—*Amber cement*, a solution of hard copal in pure ether, of the consistency of castor-oil. *E. H. Knight*.—*Armenian cement*. See *Armenian*.

—*Bituminous cement*. See *bituminous*.—*Cement-substance*, the sparse intercellular substance of endothelium which stains with nitrate of silver.—*Chalcedony cement*, a cement composed of one volume of burnt chalcedony, one volume of lime, and two volumes of white sand. It has a glaze like polished marble.—*Glycerin cement*, a cement made of glycerin and litharge, used for metals and for packing joints. It is useful for galvanoplastic purposes, as it reproduces a surface very delicately and accurately.—*Hydraulic cement*. See 2.—

Iron cement, a cement used for luting the sockets and spigots or flanges of cast-iron pipes, and for caiking the seams of steam-boller plates. It consists of sal ammoniac, sulphur, and finely pulverized castings or borings made into a paste.—*Portland cement*, *Roman cement*. See 2.—

Royal cement, a composition consisting of 1 part of sal ammoniac, 2 parts of common salt, and 4 parts of potters' earth or powdered bricks, the whole moistened with urine, and used in the cementation or purifying of gold. *E. Phillips*, 1706.—*Rubber cement*. (a) Clean caoutchouc triturated with a small quantity of sulphur and dissolved in benzine or some other hydrocarbon. It is used for covering cloth of which boots, shoes, coats, belting, etc., are made. (b) A cement for securing rubber rings or plates to metal or wood. It consists of a solution of shellac in ten times its own weight of strong ammonia, left for a considerable time to soften without heat. Also called *caoutchouc cement*. *E. H. Knight*.

cement (sē-ment'), *v.* [*< ME. *cementen* (in verbal *n. cementynge*) = *F. cimentare* = *Sp. Pg. cimentar* = *It. cimentare* (cf. *ML. cæmentare*, build); from the noun.] I. *trans.* 1. To unite by cement, as by mortar which hardens, or by other matter that produces cohesion of bodies.

Sharpe, *Surgery*.

cemental (sē-men'tal), *a.* [*< cement + -al.*] Of or belonging to cement, as of a tooth: as, *cemental tubes*. *Owen*.

cementation (sem-en-tā'shon), *n.* [*< cement + -ation.*] 1. The act of cementing; the act of uniting by an adhesive substance.—2. A metallurgical process in which two substances are heated in contact for the purpose of effecting some important chemical change in one of them. Iron may be carburized or decarburized by cementation. Thus, bar-iron, embedded in charcoal-powder and exposed to a temperature above redness, is gradually converted into steel, and in this way steel was formerly made in large quantity. This is carburization by cementation. Again, if cast-iron be embedded in the powder of red hematite and kept for some time at a red heat, it is decarburized, and acquires a considerable degree of malleability. This is the method in use for producing what is known as *malleable cast-iron*. Malleable iron is also converted into steel by keeping it immersed in molten pig-iron. This is a very ancient process, and is a kind of cementation. Silver is also separated from gold by cementation with salt and with potassium nitrate. These last methods of separation of the two precious metals are also very ancient, but are now nearly obsolete. See *case-hardening*.

cementation-box (sem-en-tā'shon-boks), *n.* The box of wrought-iron in which case-hardening is effected. See *case-hardening*.

cementatory (sē-men'tā-tō-ri), *a.* [*< cement + -atory.*] Cementing; having the quality of uniting firmly.

The rock which furnishes cement is a more or less impure limestone, or mixture of carbonate of lime with sand and clay. = *It. incensiere, < ML. incensarium (also incensorium, > F. encensoir), < incensare, burn incense: see incense*², and cf. *cense*².] 1. A vessel in which incense is burned before an altar. Censers are now usually made of metal in the shape of a cup with a perforated cover, and contain burning charcoal or other material capable of producing sufficient heat to burn the fragrant gums used as incense. The censer is swung in the hand by chains. In ancient Roman usage incense was carried to the altar in a square box called an *acerra*, from which it was taken and sprinkled on the flame. A similar practice prevailed among the Greeks. The ecclesiastical term for a censer is *thurible*. The only distinct biblical precepts regarding the use of the censer are found in Num. iv. 14 and Lev. xvi. 12. According to Bingham, neither incense nor censers were used in the Christian church during the first three centuries. They are now used in the Greek Church, the Roman Catholic Church, the Catholic Apostolic Church, and in some Anglican and other churches.

One of two superior magistrates of ancient Rome, who in the latter half of the fifth century B. C. succeeded to certain powers which had before been exercised by the consuls. Their functions included — (a) the keeping of a register (*census*) of all Roman citizens, with the amount of their property, for the ends of taxation, and for the classification of the citizens according to their possessions, from the rank of senator down; (b) the disciplinary control of manners and morals, in which their power was absolute, both in sumptuary matters and in the degradation of any citizen from his proper class for reasons affecting the moral or material welfare of the state, or in the imposition of fines at will upon those deemed by them to be offenders; (c) the practical administration of the public finances, including the control under the senate of both direct and indirect taxation, the determining of the expenditures of the state other than fixed charges, the letting of public contracts, and the supreme direction of public works. The magistracy of the *ensors* was interrupted at the time of the civil wars, and under Augustus and succeeding emperors was reestablished at various times, but with greatly diminished powers.

censoreship (sen'sōr-ship), *n.* [*< censor + -ship*.] The office or dignity of a censor; the time during which a censor holds his office.—**Censoreship of the press**, a regulation which formerly prevailed in most countries of Europe, and is still in force in some, according to which manuscripts, printed books, pamphlets, plays, and newspapers are examined by officials, civil or ecclesiastical, appointed for the purpose, who are empowered to prevent publication or suppress any parts of the text if they find anything in such books or writings objectionable to the prevailing moral or religious system. A general *censoreship* of the press was established by the Roman Catholic Church as early as 1515, and is still enforced so far as its authority extends. In England there were "licensors" of books, who were for the most part bishops; a general system of *censoreship*, established by a decree of the Star Chamber in 1637, remained in force during the civil war, and was confirmed by act of Parliament in 1643. Against this act Milton protested in his "Areopagitica": a speech for the liberty of Unlicensed Printing. The *censoreship*, or license system, was abolished in England in 1694. In France a general *censoreship* of the press existed from the introduction of printing till 1789, when it was abolished; and it has since been several times restored with various ameliorations and again abolished, finally in 1830, though a modified *censoreship* of newspapers was afterward established and still exists. In Russia there is a very rigid *censoreship* of the press. In Spain the *censoreship* was abolished by the Constitution of 1837. In Germany, after great vicissitudes, the *censoreship* has remained abolished since 1848. There is no authoritative *censoreship* in Norway, Sweden, Denmark, the Netherlands, or Belgium, but penalties are imposed upon those who offend through the press. In the United States the press is, and always has been, absolutely free from any form of political or ecclesiastical *censoreship*.

officially; it is the act of one having authority. To *censores* is to express an unfavorable opinion; it is less personal than the previous terms. *Remonstrate with* and *expostulate with* are more argumentative and imply more of advice than either *reprove* or *censores*; they also apply only to acts now taking place or about to take place, while *censores* applies only to what is past. To *reproach* a person is to lay blame upon him in direct address, and with feeling, to endeavor to shame him with what he has done. The words advance in the degree of likelihood that the person *reproved*, etc., does not admit the fault for which he is taken to task. See the distinction of corresponding nouns under *admonition*.

Chiron, the wise instructor of Achilles, and Pholus, the friend of Hercules, were beneficent centaurs. In art the centaur was originally represented as a complete man, to whose body were attached, behind, the barrel and hind quarters of a horse; later this ungainly combination was abandoned, and was universally replaced by the form in which the human

(b) A subdivision of the legion, corresponding to a modern military company of infantry, and consisting nominally of a hundred men. Prior to the rule of Marius the century was half of a manipule, and contained normally 100 men, each century having in addition 20 light-armed troops. After the military reform of Marius the old distinctions of arms in the legion were abolished; the century was still the half

of the maniple, but its normal quota of men was increased. Under the empire the regular force of the century was 110 men. See legion.

Mac. Know you what store of the praetorian soldiers Sejanus holds about him for his guard?

Lac. I cannot the just number; but I think Three centuries. *B. Jonson, Sejanus, v. 3.*

(c) An allotment of land of varying size; especially, the area of land allotted to soldiers in a conquered country.—3. A period of one hundred years, reckoned from any starting-point: as, a century of national independence; a century of oppression. Specifically, one of a number of hundred-year periods, reckoned either forward or backward from some recognized era. Thus the first century of the Christian era began with the year A. D. 1 and extended to the end of the year 100; the third century began with 201 and ended with 300; and the eighteenth century began with 1701 and ended with 1800, the year completing the hundred-year period in each instance giving name to the century. When used absolutely, without explanatory adjunct of any kind, the centuries of the Christian era are always meant. The centuries before Christ are reckoned backward in their order from the Christian era, and those after Christ are reckoned forward: as, the fourth century B. C. (from 301 B. C. backward to 400).

One crash, the death-hymn of the perfect tree,
Declares the close of its green century.

Now that the extended study of comparative anatomy and embryonic development is largely applied to the elucidation of the human structure; it is very desirable that descriptive terms should be sought which may without ambiguity indicate position and relation in the organism at once in man and [other] animals. Such terms as *cephalic* and *caudal*, dorsal and ventral, are of this class, and ought, whenever this may be done consistently with sufficient clearness of description, to take the place of those which are only applicable to the peculiar attitude of the human body. *Quain, Anat., I. 6.*

It is accomplished in various ways: by the transfer of members from the locomotive to the cephalic series; by participation of anterior locomotive organs in cephalic functions; by increased abbreviation, condensation, and perfection of structure anteriorly, with the opposite qualifications posteriorly; or (in man alone) by the uprising of the cephalic end, till at last the body becomes vertical.

(NL.) cerebellum*, a small brain, dim. of *cerebrum*, the brain; see *cerebrum*.] 1. The little brain or hind-brain of a vertebrate animal; a lobe of the brain developed on the dorsal side of the cerebrosplinal axis, between the corpora quadrigemina in front and the medulla oblongata behind, and forming part of the roof of the fourth ventricle. The pons Varolii is the corresponding ventral portion of the cerebrosplinal axis, and these two parts together are sometimes called the *eencephalon*. In man the cerebellum is a well-developed mass, having an average weight of about 5½ ounces, occupying the inferior occipital fossa, and separated from the posterior portions of the cerebral hemispheres above by the tentorium. A median portion or vermis and two lateral hemispheres are distinguished, and these are divided by transverse clefts into thin, closely packed laminae. The cerebellum has three pairs of peduncles by which it is connected with the rest of the brain: the superior peduncles, which join it with the cerebrum; the middle peduncles, which pass down on either side to form the pons Varolii; and the inferior peduncles or restiform bodies, which connect it with the medulla oblongata. The surface of the laminae is of gray matter, while the interior is white, so that a section at right angles to the lamellae presents a foliaceous appearance, which has received the name of *arbor-vitæ*. There are other masses of gray matter within, namely, the corpus dentatum, nucleus emboliformis, nucleus globosus, and nucleus fastigii. (See *corpus* and *nucleus*.) The cerebellum seems to be principally concerned with the coordination of voluntary movements. See cuts under *brain* and *corpus*.

See *esophageal ring*, under *esophageal*.—**Cerebral carotid artery**. Same as *internal carotid*. See *carotid*, *n.*—**Cerebral ganglia**, in any invertebrate, ganglia of the nervous system situated in the head, or a part of the body considered as the head.—**Cerebral hemisphere**, one of the two lateral halves forming the prosencephalon, or cerebrum in its most restricted sense. Each hemisphere is primarily divided into frontal, parietal, temporosphenoidal, and occipital lobes. The two hemispheres are connected with each other by the corpus callosum or great white commissure, and with the cerebellum by the parts below. They consist chiefly of white matter invested with gray matter, and contain ganglia of the latter in the interior. See

A *rite* is generally a prescribed or customary form, while a *ceremony* may be improvised for an occasion; as, the ceremony of laying a corner-stone or opening a new bridge. *Observance* is primarily a compliance with a requirement, as in religion, where the word was applied to the act of compliance; as, the observance of the sabbath.

Of spirit and truth; the rest, far greater part,
Will deem in outward rites and specious forms
Religion satisfied. Milton, P. L., xii. 534.

Nay, my lords, ceremony was but devis'd at first
To set a gloss on faint deeds, hollow welcomes,
Recanting goodness, sorry ere 'tis shown;
But where there is true friendship, there needs none.

The most remarkable species are those with tall columnar stems, from 25 to 50 feet high, found chiefly in northwestern Mexico and Arizona, some of

them bearing large edible fruit. The best-known of this group is the giant cactus, *C. giganteus*, of Arizona. See cuts under *Cactacea*.

cesura, cæsura (sē-zū'rā), *n.*; pl. *cesuras, cæsurae* (-rāz, -rē). [= F. *césure* = Sp. Pg. It. *cesura* = D. *cacsuur* = G. *cäsur* = Dan. *cæsur*, < L. *cesura*, lit. a cutting, < *cadere*, pp. *caesus*, cut.] In *pros.*, a division made in a line by the termination of a word, especially when this coincides with a pause in delivery or recitation. Strictly, *cesura* is the division made by the termination of a word within a foot, the division occasioned by the concurrence of the end of a word with the end of a foot being called *dieresis*. This distinction of terms is not, however, generally observed in treating of modern poetry. A *masculine cesura* is one which immediately follows a syllable bearing the ictus or metrical accent; a *feminine cesura* is one which succeeds a metrically unaccented syllable. A *cesura* is called *trithemimeral, penthemimeral, or hepthemimeral*, according as it occurs in the middle of the second, third, or fourth foot. In the dactylic hexameter the *cesura* after the first of the two short syllables of the dactyl is called the *trochaic cesura* or *cesura after the trochee* (of the second, third, or fourth foot, as the case may be). In the same kind of verse a division at the end of the fourth foot is called a *bucolic cesura*, more accurately a *bucolic dieresis*. In the following examples the *cesura* is marked by a dagger (†), the *dieresis* by a parallel (||). Thus, in the lines of English heroic verse (iambic pentapody) given below there is a *dieresis* after the third foot of the first line, and a *cesura* in the fourth and third feet of the second and third lines respectively.

Before | the hills | appéar'd, || or foun | tain flow'd,
Thou with | Eter | nait Wis | dom † didst | converse,
Wisdom | thy sis | tér, † and | with her | didst | play.
Milton, P. L., vii. 8.

A *cesura* occurs in the fourth foot of this iambic hexapody (trimeter):

To death's | bènüm | ming ö | piüm † äs | my öñ | lý cüre.
Milton, S. A., l. 630.

The remaining examples show different *cesuras* in the dactylic hexameter. One of the most usual is the *penthemimeral*: as,

Näught bät trá | ditión ré | mäins † öf | the | beaütifol |
villäge öf | Gränd-Pré. Longfellow, Evangeline, Int.

The trochaic *cesura* of the third foot is also very frequent: as,

This is the | förest prä | méval. † The | mürmüring | pines
And the | hémlocks. Longfellow, Evangeline, Int.

An example of the *bucolic cesura* (*dieresis*) combined (as is frequent) with the *penthemimeral* is:

We öur | cöunträ | fly, † thöu, | Titýrs, || strétched in the
| shädw. Longfellow, tr. of Virgil's Eclogue, i.

The *hepthemimeral* is generally preceded by a *trithemimeral* as secondary *cesura*: as,

Beárded with | möss, † änd in | garménts | gröen, † Indis-
| tintet in the | twilight. Longfellow, Evangeline, Int.

Chalcididae¹ (kal-sid'i-dë), *n. pl.* [NL., *<* *Chalcis*¹ (*Chalcid*) + *-idae*.] In *entom.*, a large family of pupivorous spiciferous hymenopterous insects, typified by the genus *Chalcis*, composed mainly of minute species most of which are parasitic on the larvæ or eggs of other insects. Some of them attack other parasites of the same or related families. The female chalcid, like the ichneumon-fly, deposits her eggs on the larva or egg which she infests, sometimes on the surface, sometimes beneath it, and often many together. The larvæ which emerge feed on the egg or on the soft parts of the infested larva; the latter is unable to complete its transformations, and eventually dies, when the chalcid emerges either as a perfect insect or as a larva, in the latter case sometimes spinning a rough cocoon in which to pass the pupa state. The *Chalcididae* in their perfect state have usually hard and often brilliantly metallic bodies, from which the typical genus, *Chalcis*, takes its name; the antennæ are elbowed; the ovipositor issues before the tip of the abdomen; the pronotum does not reach the tegulæ; and the wings are almost devoid of veins. Many species are yet undescribed. Also *Chalcidæ*.

It was founded by Fabricius in 1787. The insects of this genus are parasites, and are characterized by their swollen hind thighs and sessile abdomen. They infest many injurious insects, and transform within the bodies of their hosts without spinning a cocoon. *Chalcis albifrons* (Walsh) belongs to the closely allied genus *Spilochalcis*.

Such stone sculptures as have been found, par-

ticularly those excavated from 1877 to 1881 from the mound of Tello in southern Chaldea, indicate a much less conventional conception of the human form, and much

chalk (chāk), *n.* [Early mod. E. also *chaulk*, *< ME. chalk*, *< AS. cealc*, chalk, lime, = D. kalk = OHG. chulch, MHG. kalc (kalk-), G. ketch, kalk = Icel. Sw. Dan. kalk = F. chaux = Pr. calz, caus = Sp. Pg. cal = It. calce = Ir. Gael. caile = W. calch, lime, *< L. calx (calce-), limestone, lime, chalk*: see *calx¹* and *calx²*, and cf. *calcareous, causey*, etc.] 1. In *geol.*, a soft white rock, consisting almost entirely of carbonate of lime in a pulverulent or only slightly consolidated state, and readily soiling the fingers when handled. It is seen, when examined through the microscope, to be made up in large part of minute fragments of the shells of *Foraminifera*, mollusks, and echinoderms, and also of spicules of sponges. It does not exactly resemble any deep-sea deposit at present known to be in process of formation. This rock is a very important and conspicuous formation on the south coast of England (which on account of the whiteness of its cliffs is poetically styled Albion) and in the north of France. Under the city of London it has a thickness of from 600 to 800 feet. The chalk gives its name to the so-called Cretaceous formation. It is not known that there is any rock exactly resembling chalk in any other region than that of the Paris and London basins. Chalk, being a nearly pure carbonate of lime in a pulverized condition, is an article of great commercial importance, and is used in a large number of operations. For such purposes it is crushed and levigated. One of its principal uses is for whitening walls, or whitewashing. It is not used with oil, as it has no body with that vehicle; but, on account of its being very much cheaper than lead paint, it supersedes that article to a great extent. There are many names for the various preparations of chalk, as *whiting*, *Spanish white*, *Paris white*, etc. Chalk is not a desirable material for ordinary mortar, but it is used to some extent as one of the ingredients of hydraulic cement. *See cement*, 2.

4. An account. See *to chalk up*, below.

A long *chalk*, a long way; many degrees. To beat one by a long *chalk* or long *chalks* is to beat him by a long way, or to excel him in a high degree: in allusion to the custom of making marks, as in a score, with chalk, or to the marking of distances by lines drawn with a chalk. [*Colloq.*]

9. In *law*, an objection to a juror; the claim of a party that a certain juror shall not sit in the cause. The right of challenge is given in both civil and criminal trials, for certain reasons which are supposed to disqualify a juror to be an impartial judge. The challenge may extend either to the whole panel or body of jurors, called a challenge to the array, or only to particular jurors, called a challenge to the polls. Both of these challenges are subdivided into principal challenges (or challenges for principal cause) and challenges to the favor. A principal challenge is a challenge which alleges a fact of such a nature that, if proved, the juror is disqualified as a matter of law, without inquiring whether he is actually impartial: as, that one or more of the jury are returned at the nomination of the other party, or are nearly related to the other party. A challenge to the favor consists in the allegation by the party of a cause that might probably bias, and the raising of the question whether the juror is in fact impartial: as, a statement that a juror has already formed an opinion, or is prejudiced against the party. A peremptory challenge, allowed by statute in many jurisdictions, is a challenge of jurors, to a limited number, to be taken without showing any cause at all.

touch, and contains small grains or eminences which are of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. The extraordinary faculty which the chameleon possesses of changing its color, in accordance with that of the objects by which it is surrounded or with its temper when disturbed, is due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilatations being under the control of the nervous system. Its power of fasting and habit of inflating itself gave rise to the fable that it lives on air. The effervescent or so-called sparkling wine made within the limits of the old province of Champagne in northeastern France, chiefly in the region about Reims, Épernay, Avize, Ay, and Pierry, in the department of Marne. The vineyards are all situated within a district about twenty miles long, from Reims on the north to Vertus on the south, and are generally classed as "of the Hill" (*montagne*) and "of the River," namely, along the Marne; but great quantities of new wine are brought from other regions, and each manufacturer makes a mixture or blend according to his own system, to produce the brand of wine known by his name. The effervescence is artificially produced, and is of the nature of an arrested or incomplete fermentation. The greater or less sweetness of the wine is produced by the addition of a liqueur consisting of sugar-candy dissolved in old wine; the different degrees of sweetness are indicated by the terms *sec*, 'dry', *doux*, 'sweet', and *brut*, which last term, denoting originally the new or unmanipulated wine, is now used for the manufactured wines having from 1 to 3 per cent. of liqueur. The sweeter wines are generally the more effervescent.

These are, in general, classified as *grandes champagnes* and *finer champagnes*. The *grandes champagnes* are distilled from the wine produced in a level district called Champagne, in the department of Charente, west of Angoulême and south of Cognac. The *finer champagnes* are the product of a blending of the brandies produced in this and neighboring regions of southwestern France with alcohols derived from grain or from beet-roots, the two kinds of alcohol giving rise to distinct flavors in the brandy. An inferior grade, known as *petite champagne*, is made from grapes grown in the southern

part of the district.—**Champagne rosé**, champagne having a slightly pink or ruddy tint. This color is usually produced by the addition of a little red wine.—**Still champagne**, properly, non-effervescent wine made in Champagne, of which the best-known is *sillery sec*; improperly, slightly effervescent champagne, as distinguished from the *grand mousseux* or frothing variety.—**Tisane de Champagne**. See *tisane*.

Champlain (sham-plān'), *a.* [*< Lake Champlain, bordering on New York, Vermont, and Canada.*] In *Amer. geol.*, a term first employed by Emmons to designate a part of the Paleozoic series of the State of New York. Later suggested by Dana as the name of a division of the superficial (Post-tertiary) deposits of northeastern North America, connected in origin, according to the prevalent glacial theories (see *glacial*), with the melting of the great ice-sheet supposed by many geologists to have once extended over that region.

The loose deposits or drifts overlying the lower unstratified boulder-clay belong to the period of the melting of the great ice-sheets, when large bodies of water, discharged across the land, levelled down the detritus that had formed below or in the under part of the ice. This remodelled drift has been called the *Champlain* group.

In small churches having no separate choir the altar-rails (and in some churches the screen or latticework) divide the chancel immediately from the body of the church. In a wider sense the words *chancel* and *choir* are sometimes used to include both the sanctuary and the choir proper. In Greek churches the *bema* answers to the chancel or sanctuary, and the *iconostasis* (as the choir does not intervene between sanctuary and nave) corresponds in some measure to both altar-rails and rood-screen, to the former as separating the altar from the rest of the church, and to the latter as constituting a marked boundary to the nave.

Sw. kansler = Icel. kansellari, kanselleri = Russ. kanslerû, < ML. cancellarius, a chancellor, orig. (LL.) an officer in charge of records, who stood at the latticed railing inclosing the judgment-seat, and acted as an intermediary between the suitors and the judge; < L. cancelli, a latticed railing: see *chancel* and *cancelli*, and cf. *chancery*.] 1. Originally, under the later Roman emperors, a doorkeeper or usher, who stood at the latticed railing inclosing the judgment-seat, to keep off the crowd and to introduce such persons as were entitled to pass inside. Later and naturally he became a sort of intermediary between petitioners and the judges, and arranged about their business. In the Eastern Empire, the Roman-German empire, and the kingdoms established on the ruins of the Roman empire, this intermediary doorkeeper became a notary or scribe on whom devolved the duty of preparing and sealing all important documents, such as charters, letters, and other official writings of the crown; hence he became keeper of the great seal, and in consequence of the influence of his position his office came to be one of the most important. From the Roman empire the ecclesiastical court at Rome introduced the office, and the chancery at the Vatican was repeated throughout the several bishoprics, where each diocese, and frequently each of the great monastic houses, had its chancery. Hence—2. A secretary; a notary.*

3. In Great Britain: (a) The highest judicial officer of the crown, law adviser of the ministry, and keeper of the great seal: more fully designated *lord high chancellor*. He is a cabinet minister and privy councillor by virtue of his office, and prolocutor of the House of Lords by prescription, and ranks next after the princes of the blood and the Archbishop of Canterbury. The writs for the convocation of Parliament are issued by him. To him belongs the appointment of all justices of the peace, and he is the patron of all livings of the crown under the value of twenty marks in the king's books; he is keeper of the sovereign's conscience, visitor of all hospitals and colleges founded by the king, guardian of all charitable uses, and judge of the High Court of Chancery, now called the Chancery Division of the Supreme Court. There is also a lord high chancellor in Ireland at the head of the equity system of that country, and Scotland had a chancellor until the treaty of union with England in 1707. (b) An officer, officially styled *chancellor of the duchy of Lancaster*, who presides in person or by deputy over the courts of law and equity in the duchy of Lancaster. He is usually a cabinet minister, and seldom a lawyer. (c) The finance minister of the British government, more fully styled *chancellor of the exchequer*. He is invariably a member of the House of Commons (that division of the legislature having the sole right of laying taxes and originating money bills) and also of the cabinet. The chancellor of the exchequer was formerly a judge *ex officio* in the equity department of the Court of Exchequer, taking precedence of all the barons; but when the equitable jurisdiction of this court was transferred by 5 Vict. v. to the Court of Chancery his judicial functions became obsolete. A pleasant grove,
With *chant* of tuneful birds resounding loud.
Milton, P. R., ii. 290.

Specifically—(a) A melody composed in the Ambrosian or Gregorian style, following one of the ecclesiastical modes, having often a note for each syllable, and without a strict rhythmical structure: sometimes called a *tone*; when used in contrapuntal composition, called a *canto fermo*. (b) A Gregorian melody, usually of ancient origin, intended to be used with a prose text in several verses, several syllables in each verse being recited or intoned upon a single note. A Gregorian chant of this kind has five parts: the intonation, the first dominant or reciting-note, the mediation, the second dominant or reciting-note, and the ending or cadence. (c) A short composition in seven measures, the first and fourth of which contain but one note, whose time-value may be extended at will so as to accompany several syllables or words, while the remaining measures are sung in strict rhythm: commonly called an *Anglican chant*, because most extensively used in the services of the Anglican Church for the canticles and the psalms. An Anglican chant consists of two parts, the first of three and the second of four measures; each half begins with a reciting-note and ends with a cadence; the first cadence is also called the *mediation*. A *double chant* is equal in length to two typical or single chants, that is, contains fourteen measures, four reciting-notes, etc. The distribution of the words of a text for use with a chant is called *pointing* (which see). The Anglican chant is probably a modernized form of the Gregorian, without an intonation, having the mediation and cadence made strictly rhythmical, and following the modern ideas of tonality and harmony. (d) Any short composition one or more of whose notes may be extended at will so as to accompany several syllables or words.

In each joint or cell of the latter is produced one atherozoid coiled spirally. The carposporium consists of a central cell which, after fertilization, becomes the fruit and is inclosed by 5 cells twisted spirally around it. The species are usually grouped in two families, each containing two genera. In the *Characeæ*, represented by *Chara*, the stem and leaves are sometimes covered with a cortical layer of cells and are sometimes naked. The leaves are in whorls of from 6 to 12, and the leaflets are always one-celled. In *Nitelleæ*, represented by *Nitella*, the stems are never corticated, and the leaflets are in whorls of from 5 to 8, and often more than one-celled. The circulation of the protoplasm is easily observed in the cells of many *Characeæ*. Several species are incrustated with lime and are very brittle.

Early in the history of English law, the chancellors established the rule that informalities and illegalities which by the common law would invalidate a private trust should not be allowed to defeat a public charity, and that therefore chancery should intervene to prevent the heirs or next of kin from defeating such a gift, should appoint a trustee if none existed, and, if any of the directions of the founder were impracticable, should supply others approximate thereto. The most familiar application of the rule is in the doctrine that the prohibition against perpetuities does not affect a charity. (See *perpetuity*.) The question what constitutes a charity within this rule has been the subject of much litigation.—**Brothers of Charity**. (a) The great charter of the liberties (*Magna Charta Libertatum*) of England, signed and sealed by King John in a conference between him and his barons at Runnymede, June 15th, 1215. Its most important articles are those which provide that no freeman shall be taken, or imprisoned, or proceeded against, except by the lawful judgment of his peers or in accordance with the law of the land, and that no scutage or aid shall be imposed in the kingdom (except certain feudal dues from tenants of the crown), unless by the common council of the kingdom. The remaining and greater part of the charter is directed against abuses of the king's power as the feudal superior. The charter granted by Henry III. is only a confirmation of that of his father, King John. As between private persons it is also loosely applied to deeds and instruments under seal for the conveyance of lands; a title-deed. *Royal charters* are such as are granted by sovereigns in conveying certain rights and privileges to their subjects, such as the Great Charter granted by King John (see *Magna Charta*, under *charta*), and charters granted by various sovereigns to boroughs and municipal bodies, to universities and colleges, or to colonies and foreign possessions; somewhat similar to which are charters granted by the state or legislature to banks and other companies or associations, etc. In *Scots law* a charter is the evidence of a grant of heri-

table property made under the feudal condition that the grantee shall annually pay a sum of money or perform certain services to the grantor, and it must be in the form of a written deed. The most common charters are feu charters. (See *feu*.) In *American law* a charter is a written grant from the sovereign power conferring rights or privileges upon a municipality or other corporation. The term is generally applied to the statute, letters patent, or articles of association sanctioned by statute, creating a corporation, as a city, college, stock-company, benevolent society, or social club.

= *Syn.* 1. *Punish*, *Chasten*, *Chastise*. To *punish* is primarily and chiefly to inflict pain upon, as a retribution for misdeeds, the notion of improving the offender being absent or quite subordinate. *Chasten*, on the other hand, implies that the reformation of the offender is the aim of the punishment inflicted. It. *casupola*, a shanty), dim. of L. *casa*, a house: see *casa*. Cf. *casula* and *cassock*, of the same ult. origin.] *Ecclies.*, a sleeveless vestment, originally circular in outline, but in medieval and modern use of an elliptical shape, or modified from this so as to be nearly rectangular, and provided with an aperture in the center through which to pass the head. It is worn so as to fall in front and at the back of the wearer to an equal or nearly equal distance, showing only one of its halves at a time. The chasuble is the principal vestment worn by a priest when celebrating the mass or holy communion, and is put on over the alb. It is held to represent the seamless coat of Christ, or charity symbolized by it. The material is usually rich stuff—silk, brocade, or velvet. In its oldest form it was very full and long, reaching nearly to the feet. The medieval or elliptical form, which is sometimes worn in Roman Catholic churches, reaches below the knees, and is generally ornamented with gold or other embroidery, and are known as the *orphreys of the chasuble*. Among the different names of the chasuble, *pasueta*, identifying it with the ancient Roman garment of that name, is probably the oldest. The same word occurs also in various Greek forms. It is translated "cloak" in 2 Tim. iv. 13, and is the accepted name for the chasuble in the Greek Church, generally in the form *phelonion*. The name *planaeta* has also been in use from early times, and is still the term preferred in the official use of the Roman Catholic Church. The *amphibalus*, worn at one time in Gaul, seems to have been similar to or identical with the chasuble. In England the name *vestment* was in use at the time of the Reformation, both for the chasuble alone and for the chasuble with its subsidiary vestments or adjuncts, the stole, amice, and maniple. The use of the chasuble in Anglican churches continued long after the Reformation, and is maintained by certain of them (on authority claimed from the Ornaments rubric) at the present day. It is also worn in the Greek Church. See *ornament*.

ly worn in the Roman Catholic Church, however, does not reach much below the hips, and is nearly rectangular at the back, the part which falls in front being cut away at the sides so as not to impede the movement of the arms, and the two parts are frequently united merely by straps at the shoulders. The chasuble generally has a pillar or vertical stripe at the front, a Y-cross or Latin cross on the back, or on both front and back, and sometimes an edging on both sides. These ornaments are added in a different material with gold or other embroidery, and are known as the *orphreys of the chasuble*. Among the different names of the chasuble, *pasueta*, identifying it with the ancient Roman garment of that name, is probably the oldest. The same word occurs also in various Greek forms. Two or more pieces can be taken at once if similarly exposed, with one intervening empty square between each pair into which the adversary can "jump." The object of each player is to capture all his opponent's men, or to hem them in so that they cannot move. See *casin*, etc. The Scand. word is different: Icel. *ostr*—Sw. Dan. *ost*, cheese.] 1. The curd or casein of milk, coagulated by rennet or some acid, separated from the serum or whey, and pressed in a vat, hoop, or mold. All the acids separate the cheese from the whey; neutral salts, and likewise all earthy and metallic salts, produce the same effect; but rennet, which is made by macerating in water a piece of the last stomach of a calf, salted and dried for this purpose, is most efficient. The flowers of the *Galium verum*, or yellow lady's-bed-straw, and the juice of the fig-tree very readily coagulate milk. There are many kinds of cheese, which differ from one another according to the quality of the milk employed and the mode of preparation. *Soft cheeses*, such as cream-cheese, Bath and Yorkshire cheese, will not keep long. *Hard cheeses*, as Cheshire, Gloucester, Cheddar, Parmesan, and Dutch, can be kept a long time. There is also an intermediate class, as Gruyère, Stilton, etc. Cheese is composed of from 30 to 50 per cent. of water, 20 to 35 per cent. of casein, 13 to 30 per cent. of fat, and 4 to 6 per cent. of mineral matter.

The *Testudinata* or shield-reptiles; the turtles and tortoises; an order of *Reptilia*, in which the body is enclosed in a shell consisting of a carapace and a plastron, from between which the head, tail, and four limbs protrude. These animals have the bones of the skull united to such a degree that the quadrates and pterygoids form part of the same mass as the rest; there are no teeth, the jaws being increased in horn and forming a beak; the eyes are provided with eyelids; and a sacrum is developed. In consequence of the formation of the shell, the cervical and caudal regions are the only movable parts of the spinal column; the dorsal vertebrae are devoid of transverse processes; the ribs are not movable upon the vertebrae; and the union of the vertebrae and ribs by means of superficial bony plates almost always forms the carapace or upper shell, the lower shell or plastron being composed of dermal bones, usually 9 in number, 1 median, and 4 lateral and paired. Tortoise-shell is the peculiar epidermal or exoskeletal integument of the bony case. The lungs extend into the abdominal cavity with the other viscera. The *Chelonidæ* are generally sluggish, cold-blooded animals, very tenacious of life, and able to pass

long periods without food. Some, however, are quite active. They are oviparous. Most of the species are carnivorous and predatory, but the true land-tortoises are mainly herbivorous. There are over 200 species, among them a few gigantic ones, as the tortoises of the Galapagos and Mascarene Islands: one of the fossil species is said to have been about 20 feet long. The living genera are very numerous. The *Chelonia* are variously subdivided. They were formerly generally distributed among four families, the club-footed land-tortoises, the related fresh-water tortoises, the soft tortoises, and the sea-turtles. Huxley called these four groups *Testudinæ*, *Emydæ*, *Trionychoidæ*, and *Eueretæ*. These groups have, however, been long discarded, and the species are now segregated among many families which have been variously combined. Most of the species of the southern hemisphere belong to a peculiar old-fashioned group, the pleurodirous, while those of the northern are cryptodirous. Also *Chelonides*, *Chelonii*.

Chemical acetication. See *acetication*.—**Chemical action**. See *action*.—**Chemical affinity, elective affinity**, names formerly used for chemical force, and implying a property inherent in atoms of selecting other atoms with which to unite, or of preferring one combination to another.—**Chemical analysis**, the resolution of complex bodies into their elements. It is either qualitative or quantitative. Qualitative analysis consists in the determination of the component parts merely as respects their nature, and without regard to their relative proportions. Quantitative analysis consists in the determination of the relative proportions of the components.—**Chemical black, bronze**. See *black, bronze*.—**Chemical change**, as distinguished from *physical change*, a change which destroys the identity of the substance affected. A physical change is manifested without loss of identity by the substance. Thus, a mass of copper may be reduced to fine particles, drawn into wire, melted and cast into ingots or charged with electricity, without losing its identity as copper. But if copper is put into nitric acid, it dissolves and is converted into another substance, copper nitrate. The copper, in consequence, has lost its identity, and has undergone a chemical change.—**Chemical combination**, the intimate union by chemical force of two or more elements or compounds to form a new compound differing in properties from either of its constituent bodies. It differs from *mechanical mixture* in that each element of a chemical combination has a certain fixed and invariable combining proportion, whereas a mixture of substances can be made with varying amounts of its ingredients. In a mechanical mixture the particles of each of its ingredients can usually be identified and separated by mechanical means; in a chemical combination the constituents are so blended that they cannot be identified. Thus, if chlorine and hydrogen gas are mixed in any desired proportion, the chlorine in the mixture will be evident by its characteristic color and odor. But if this mechanical mixture is exposed to strong light, a chemical combination takes place rapidly between the two gases, with evolution of heat. They combine, however, only in exactly equal volumes, and if an excess of either is present it remains uncombined. In the new compound, hydrochloric acid, chlorine cannot be detected by either color or smell, nor be isolated except by chemical means.—**Chemical decomposition**, the separation by chemical force of the component parts of bodies from one another, or the resolution of bodies into their elements.—**Chemical equation**, a symbolic expression used to represent a chemical reaction. The reagents, or bodies which enter into the reaction, form the left-hand member of the equation, and the resultants of the reaction form the right-hand member. Thus, the fact that calcium chlorid and sodium carbonate when brought together in solution react on each other, forming calcium carbonate and sodium chlorid, is expressed by the following equation:

$CaCl_2 + Na_2CO_3 = CaCO_3 + 2NaCl$.

This is a true equation in the algebraic sense, because the value of the two members is the same. Since matter is indestructible, nothing is lost in the reaction, and the weights of calcium chlorid and sodium carbonate which reacted must be precisely the same as the combined

weights of the resultant calcium carbonate and sodium chloride.—**Chemical equivalent, extinguisher, ferment, fire-engine, etc.** See the nouns.—**Chemical force**, the force which binds together the atoms in a molecule, and causes chemical changes when dissimilar molecules are brought within the sphere of its action under proper conditions.—**Chemical formula**, a symbolic expression used to represent the composition of a substance. In the formulas now generally adopted by chemists each elementary substance is indicated by the first letter or letters of its name, called its chemical symbol; and to express the compounds of the elements, their symbols are arranged together, each denoting a single atom, and small numbers are written after a symbol and a little below (sometimes, and formerly always, above) the line, indicating how many atoms of the element exist in the compound. Thus, H means 1 atom of hydrogen; H₂O means 2 atoms of hydrogen united with 1 of oxygen, forming the compound water; KIO means 1 atom of potassium (kalium), 1 of hydrogen, and 1 of oxygen, forming the compound potassium hydrate; and so on. If a number is placed at the beginning of the formula, it multiplies the entire formula like an algebraic coefficient; thus, 2H₂O means 2 parts or 2 molecules of water. So, too, a small number placed after a parenthesis multiplies the portion included; thus, Ca₃(PO₄)₂ denotes 3 atoms of calcium combined with 2 equivalents of the radical PO₄, forming tricalcium phosphate or bone phosphate. Chemical formulas are of two kinds, *empirical* and *rational*. An empirical formula expresses simply the relative number of atoms of the elements present; a rational formula expresses not only the relative number of atoms, but also some conception of the mode of union of the atoms, the groups of radicals contained in the substance, the class to which it belongs, etc. Thus, the empirical formula of acetic acid is C₂H₄O₂. Its rational formula (C₂H₃CO.OH) indicates that it may be regarded as made up of the radicals methyl (CH₃), carbonyl (CO), and hydroxyl (OH), and so suggests to the chemist many of its properties and reactions. See *graphic formula*, under *graphic*.—**Chemical harmonicon, hygrometer.** See the nouns.—**Chemical kinetics**, the science which treats of the phenomena of bodies or systems of bodies when chemically active.—**Chemical match.** See *match*.—**Chemical paper**, paper used or suitable for use in the operations of chemistry, as litmus paper, etc.—**Chemical rays of the spectrum.** See *spectrum*.—**Chemical statics**, the science which treats of the phenomena exhibited by chemical bodies or systems of bodies in equilibrium.

battlements, and affording means of communication between towers and bastions. In the earlier castles the system of defense adopted involved almost complete separation of each tower or post from the others; and the *chemin-de-ronde* was intercepted by each of these; this caused the loss of many fortresses, a sudden attack often shutting up the defenders in their isolated posts. The castles of the fourteenth century were free from this defect, the *chemin-de-ronde* becoming spacious and uninterrupted, so that the garrison could be massed readily at any point.

chemistry (kem'is-tri), *n.* [Also recently *chymistry*, by apheresis for earlier *alchymistry, alchymistry*; now regarded as *< chemist + -ry*: see *chemist, alchemy, and alchymistry*. Other names for the science are *chemics* and *chemy*: see these words.] The science of the composition of material things and the changes which they undergo in consequence of changes in their ultimate composition. It regards all substances as made up of atoms (see *atom*) which are indivisible and have certain unchanging properties. An elementary substance consists of groups of chemically united atoms of the same kind; a compound substance, of groups of chemically united atoms of two or more different kinds. All compound substances, and most elementary ones, consist of definite groups of chemically united atoms which are called *molecules*. Each molecule has exactly the same chemical composition and properties as the whole mass of the substance, and is the smallest mass into which the substance can be divided without losing its identity. The laws, causes, and effects of changes in the kind, and the number and arrangement, of atoms within the molecule are the subject-matter of the science. Also called *applied chemistry*.—**Theoretical chemistry**, the study of the general laws governing chemical action, and of their bearing on the theories of matter.—**Thermal chemistry, or thermo-chemistry**, treats of the phenomena and laws of the development and disappearance of heat induced by chemical reactions.

chemotype (kem'i-tīp), *n.* [*< chemi(cal) + type.*] A process for obtaining casts in relief from engravings. A polished zinc plate is covered with an etching-ground, on which the design is etched with a point and bitten in with dilute aqua fortis. The etching-ground is then removed, and every particle of the acid well cleaned off. The plate is covered with filings of a fusible metal, and heated until the metal has melted and filled the engraving. When cold it is scraped away to the level of the zinc plate in such a manner that none of it remains except what has entered the engraved lines. The plate is next submitted to the action of a weak solution of muriatic acid; and, as the one of these metals is negative and the other positive, the zinc alone is eaten away by the acid, so that the fusible metal which has entered the hollows of the engraving is left in relief, and may be printed from in a press. Chemotype is particularly adapted for the production of maps.

Traditionally, the name is referred to *Cerasus*, L. *Cerasus*, Gr. *Κερασιος*, an ancient town in Pontus, where the cherry-tree was native.] I. n.; pl. *cherries* (-iz). 1. The fruit of species of *Cerasus* (which is commonly regarded as a subgenus of *Prunus*), consisting of a globose pulpy drupe inclosing a one-seeded smooth stone; also, a tree producing this fruit. The cultivated varieties of the garden-cherry probably all belong to two species, *Prunus Cerasus* and *P. avium*, both doubtless natives of Europe. It is related by Pliny that this fruit or a cultivated variety of it was brought from Cerasus in Pontus to Italy after the defeat of Mithridates by Lucullus, about 70 B. C. It was introduced into England by the Romans about 120 years afterward. There are many kinds, as the red, black, and white-hearts, the Mayduke, bigaroon, morello, Kentish, etc. The wild or crab cherry, mazard or gean of Great Britain, is a wild state of the *Prunus avium*, which is also found in various other parts of Europe. From the fruit of its different varieties several highly esteemed cordials are prepared, as the maraschino of Italy, the ratafia of France, the kirschwasser of Germany, etc. To this group of cherries, distinguished by having their flowers and fruits in clusters, belong also the mahaleb cherry (*P. Mahaleb*) of Europe, with its very fragrant flowers, and the ground-cherry (*P. Chamaecerasus*), as well as the wild red cherry (*P. Pennsylvanica*) and the dwarf cherry (*P. pumila*) of North America. A second section of the genus has the flowers in racemes, and the fruit smaller and less palatable. To this belong the bird-cherry (*P. Padus*) of Europe, and the wild black cherry, also called the rum- or cabinet-cherry (*P. serotina*), and the choke-cherry (*P. Virginiana*) of America. Still a third section consists of evergreen trees, with the flowers in racemes and the fruit inedible, including the bastard cherry, bay-cherry, or laurel-cherry (*P. Lauro-Cerasus*) of Europe, and the Carolina laurel-cherry (*P. Caroliniana*) of the southern United States.

some with Assyrian *kirubu*, a name of the steer-
god, the winged guardian at the entrance of As-
syrian palaces. The pl. *cherubim* occurs earlier
in the accom. form *cherubin*. A double E. pl.
cherubims occurs in the Bible and elsewhere.] 1.
One of an order of angels variously represent-
ed at different times, but generally as winged
spirits with a human countenance (often simply
as winged heads), and distinguished by their
knowledge from the seraphs, whose distinctive
quality is love. In the celestial hierarchy cherubs are
represented as next in order to seraphs. The first men-
tion of cherubs is in Gen. iii. 24, where their figure is not
described, but their office was, with a flaming sword, to
keep or guard the way of the tree of life. Figures of a
pair of cherubs were placed on the mercy-seat of the ark,
and a pair of colossal size overshadowed it in Solomon's
temple with the canopy of their contiguously extended
wings. They are called "the cherubims of glory" (Heb.
lx. 5), as on them the glory, when visible, rested. They
were anointed with the holy oil, like the ark itself and
the other sacred furniture. Their wings were stretched
upward, and their faces turned "toward each other, and
toward the mercy-seat." The cherubs seen in Ezekiel's
vision had each four heads or faces, the hands of a man,
and wings. The four faces were the face of a cherub, that
of a man, that of a lion, and that of an eagle. They had
the bodily form of a man. (Ezek. x.) The hieroglyphical
and emblematical figures embrodered on the veils of the
tabernacle were called "cherubims of cunning work" (Ex.
xxvi. 1).

And he ategh [ascended] over *cherubin*.

The squares are alternately light and dark, and in beginning a game the board must be so

of each are placed a bishop, a knight, and a rook, in this order. The pieces move according to certain laws over unoccupied squares, the knight alone being free from this latter restriction (see below). The king moves one square in any direction (except into check); the queen in any direction and to any distance along the rows of squares, and also along the diagonals; the rooks or castles in any direction along the files or ranks of squares; the bishops (of which there is one on each color) in any direction along the diagonals of the color on which they are originally placed; the knights one square on one row and then two squares on the row at right angles to it (or two squares and then one) in any direction, without reference to interposing pieces; and the pawns one square ahead on the files. A piece is taken by removing it from the board and placing the capturing piece in its place. In taking, each piece makes some one of its ordinary moves, except the pawn, which takes by moving one square forward on a diagonal; the knight alone can take by jumping over an intervening piece. The object of the game is to capture the king of the opposing party; and this is effected by an attack so planned that it is impossible, either by moving the opposing king or by interposing another piece, to prevent him from being taken on the next move—that is, by placing the opposing king in a check from which he cannot escape. (See *check*¹, *checkmate*, and *stalemate*.) The squares of the board are commonly numbered along the files, forward from either party, from the principal pieces placed upon them at the beginning of a game: as, the queen's rook's square (abbreviated Q. R. sq.), queen's rook's second square (Q. R. 2), etc.

Four and twenty ladies fair

Were playing at the chess.

The Young Tamlane (Child's Ballads, I. 117).

Chess has been known to the Chinese for many centuries under a form not very unlike our own game. The board has 64 squares, is played with 16 men on each side, the two at the corners having equal power, and the next two (called horses) having a move equivalent to that of our knight. The chief differences are that the Chinese adversaries are separated by a river, over which some pieces cannot pass, while the "King" is confined to a square of nine moves only; and that the pieces are placed upon the intersections of the lines forming the board, instead of on the squares. Giles, Glossary of Reference, p. 38.

The origin of the game of *chess* is lost in obscurity, a fact which has rather invited than repelled learned speculations on the subject. The invention of the pastime has been variously ascribed to the Greeks, Romans, Babylonians, Scythians, Egyptians, Jews, Persians, Chinese, Hindus, Arabians, Araucanians, Castilians, Irish, and Welsh. largely influenced by this material. The roofs are usually tiled, and have characteristically a hollow dip, as if copied from the form of a tent. When rectangular, the lower corners are sharply turned up. Roofs in several projecting tiers, one over the other, are usual in temples and towers. The tiling of the roofs is often glazed in various colors, and the walls are frequently incrustated with porcelain tiles, and sometimes with marble slabs. The porcelain tower or *ta* of Nanking, destroyed in 1853, was a building of this nature; it was 200 feet high, had 9 stories, and was surmounted by an iron spire or finial. The *pa-loe*, or carved memorial gateway, is another feature of Chinese architecture. A peculiarity of Chinese building is the practice of beginning with the roof, which is supported on posts, and the walls are then built beneath it. Chinese drawing and painting are often of great delicacy, but show no knowledge of perspective. In the decorative branches of art, much of the work of the Chinese is of high merit. Their small bronzes, and carvings in wood and ivory, are of great technical excellence, and as makers and decorators of porcelains they are unsurpassed. They are fond of the grotesque, and are very successful in decorative treatment of it, as, for instance, in their favorite carved and painted figures of dragons and kindred fantas-

tic creations.—*Chinese blue*, *capstan*, *classics*, *cross-bow*, *duck*, *fire*, *lantern*, *wax*, *white*, *yellow*, etc. See the nouns.

II. n. *1. sing.* and *pl.* (plural also formerly *Chinees*). A native or natives of China; specifically, a member or members of the principal indigenous race of China proper, as distinguished from other Mongoloids, such as the Manchus, the present ruling race in the Chinese empire.

2. The language of China. It is a monosyllabic tongue, and on this ground is generally classed with the other languages of the same character in southeastern Asia, in Further India and the Himalayas, as constituting the monosyllabic family. It exists in many dialects, of which the so-called Mandarin is the leading and official one. It is composed of only about 500 words, as we should distinguish them in writing, all of them ending in a vowel-sound or in a nasal, although some of the dialects still retain final mutes, lost in Mandarin. This small body of words, however, is raised to 1,500 by differences of the tone of utterance, as rising, falling, even, abrupt, and so on. The language is without inflection, and even without distinction of parts of speech; but words are classed as "full" or "empty," according as they are used with their full meaning or as auxiliaries in forming phrases: like our *will* and *have* in "I will it," "they have it," on the one hand, and in "they will have seen it," on the other. Chinese records go back to about 2000 B. C., and the literature is immense and varied. The mode of writing is by signs that represent each a single word in one of its senses or in a certain set of senses. The signs are of ideographic or hieroglyphic origin; but the greater part of them at present are compound, and many contain a phonetic element along with an ideographic. They number in the dictionaries about 40,000; but only the smaller part of these are in current and familiar use. They are written in perpendicular columns, and the columns follow one another from right to left. The language and mode of writing have been carried to the neighboring nations that have received their culture from China, especially Japan, Corea, and Annam, and have been more or less borrowed or adopted by such nations.

1. In *anc. Gr. costume*, a form of mantle which left both arms free, worn especially by equestrians, hunters, and travelers, and by soldiers. The chlamys, which was much smaller than the himation, consisted of an oblong piece of stuff having three straight sides and one long side curved outward. It was worn by bringing the two ends of the straight side opposite the curved side together around the neck, and fastening them with a buckle or fibula. The buckle was pulled around to the front, to either shoulder, or to the back, to suit the convenience of the wearer. The extremities of the curved side were weighted so as to hang vertically; and when the chlamys was caught together on one shoulder, as it was commonly worn, these hanging ends were likened to wings by the old writers. The paludamentum of the later Roman emperors was called *chlamys* by the Greeks.

The *chlamys* [in the sculptures of the Mausoleum] floating behind the Amazon on horseback adds to its simplicity a massiveness of fold and general form beyond anything to be seen in similarly floating drapery on the other slabs.

The hydrate of chloral (CCl₃.CH(OH)₂), as now prepared, is a white crystalline substance having a pungent odor and an acid taste. In contact with alkalis it separates into chloroform and formic acid. In medicine it is used as a hypnotic, and in doses of from 15 to 30 grains usually produces calm sleep, which lasts for several hours, and is not followed by unpleasant effects, such as frequently attend the use of morphine. An elementary gaseous substance contained in common salt, from which it is liberated by the action of sulphuric acid and manganese dioxide. Chlorin has a yellowish-green color and a peculiar smell, and irritates the nostrils very violently when inhaled, as also the trachea and lungs. It exercises a corrosive action upon organic tissues. It is not combustible, though it supports the combustion of many bodies, and indeed spontaneously burns several. In combination with other elements it forms chlorids, which serve most important uses in many manufacturing processes. It can be liquefied by cold and pressure. It is one of the most powerful bleaching agents, this property belonging to it through its strong affinity for hydrogen. Hence in the manufacture of bleaching-powder (chlorid of lime) it is used in immense quantities. When applied to moistened colored fabrics, it acts by decomposing the moisture present, the oxygen of which then destroys the coloring matter of the material. It is a valuable disinfectant when it can be conveniently applied, as in the form of chlorid of lime. See *calc chlorata*, under *calc*. — **Chlorin process, in metal.**, a process extensively used for separating gold from silver. It is based upon the fact that gold at

a red heat has no affinity for chlorin, the chlorid of gold being reduced to the metallic state by heat alone, while this is not true of the metals with which the gold is usually alloyed.

When skillfully administered, in proper cases, it is a safe anesthetic. chromium (krō'mi-um), *n.* [NL. (from the beautiful colors of its compounds), < Gr. χρωμα, color, + -ium.] Chemical symbol, Cr; atomic weight, 52.14; specific gravity, 6.8-7.3. An element belonging to the metals, obtained in the pure state as a light-green crystalline powder.

The separate crystals under the microscope have a tin-white color. It is less fusible than platinum, and after fusion is harder than corundum. It oxidizes slowly in the air, but burns vividly in oxygen. Hot hydrochloric or sulphuric acid dissolves it; nitric acid does not affect it. Chromium does not occur native. It is found in the mineral crocoite or crocoelite (lead chromate), and as a sulphid in daubreelite; it occurs also in some meteoric iron, and the fine green color which makes the emerald valuable is believed to be due to chromium; but the most abundant ore of chromium is chromite or chrome-ironstone.

Among its most important compounds are the oxid or sesquioxid (Cr₂O₃), which occurs native in chrome-ocher and chromite. It is a dull-green powder when made artificially by reduction of the chromate, and is used extensively for imparting a green color to porcelain and enamel, and somewhat as a pigment, in the form of chromic oxid, under the name of *Guignet's green*.

potassium bichromate (K₂Cr₂O₇) is the salt from which most salts of chromium are prepared. It forms garnet-red crystals, which dissolve in water, making a red solution. chromolithography (krō'mō-li-thog'ra-fī), *n.* [*Gr.* χρώμα, color, + lithography.] A method of producing colored lithographic pictures by the use of a number of prepared lithographic stones. The general outline and the outline of each of the tints in the picture to be reproduced are first traced, and then transferred to the first stone, or keystone, by the ordinary methods of lithography, or the design is drawn directly on the keystone. For the coarser kinds of coloring the outlines of the design are made upon zinc plates with pen or brush, and thence transferred to the stone. From the keystone, which bears the skeleton design, the outlines of each tint are separately transferred to as many other stones as there are colors in the picture, sometimes as many as forty. The first impression, taken by the printer from the keystone, gives the outlines of the picture, the second, taken from another stone, all the yellow tints, the third all the reds, and so on until all the colors needed are given. Before each successive impression the sheets are adjusted to a nicety, in order that the colors may not overlap one another. This adjustment is called the *register*. After the printing is completed the sheets are sometimes passed through an embossing-press, to give them a canvas-like surface.

chronograph (kron-ō-graf), *n.* [*Gr. χρονογράφος*, recording events (see *chronography*), lit. recording time, < *χρόνος*, time, + *γράφειν*, write.] 1. A chronogram.—2. An instrument for recording the exact instant in which an event occurs. The most important instrument of this kind is the astronomical chronograph, the parts of which are: (a) a train of clockwork, regulated, not by an ordinary escapement, but in such a way as to move with a continuous and enable motion, and carry forward a sheet or ribbon of paper; (b) a pen which draws a continuous line upon the paper, and is so attached to the armature of an electromagnet that whenever the electric current is broken (or made) for an instant a jog is produced in the line drawn by the pen. The electromagnet is put into one circuit with a clock or chronograph which breaks (or makes) the circuit for an instant at every second, or other convenient interval, and also with an observing-key, which on being pressed (at the moment the observation is taken) produces the same effect. The result is that jogs appear upon the line drawn by the pen at every second, and also every time the key is touched; and the relative distances of these jogs, which can be accurately measured, give the time of the observation correct to a fiftieth of a second. The name *chronograph* is also applied to various kinds of watches so contrived that when a button is pressed the second-hand stops, or one of two second-hands stops, or the second-hand leaves a dot of ink upon the dial.

3. An instrument for measuring a small interval of time. The simplest instrument of this description consists of a tuning-fork carrying at the end of one of its prongs a bit of quill, which scratches a wavy line upon a moving piece of blackened paper. At the beginning and at the end of the interval to be measured an induction-spark is made to pass through the paper close to the marking-point. Two little dots are thus made, and the number of waves and fractions of a wave between them gives the interval of time expressed in terms of the period of vibration of the fork as a unit.—**Boulenger's chronograph**, an instrument by means of which a small interval of time is determined by measuring the space described by a falling body during the interval. It is the instrument most used for obtaining initial velocities. Bashforth's chronograph is also used for this purpose.

Any instrument that measures time, or divides time into equal portions, or is used for that purpose, as a clock, watch, or dial.—2. Specifically, a time-keeper of great accuracy designed to be used for determining the longitude at sea, or for any other purpose where a very exact measurement of time is required.

The marine chronometer differs from the ordinary watch in the principle of its escapement, which is so constructed that the balance is free from the wheels during the greater part of its vibration, and also in being fitted with a compensation adjustment, calculated to prevent the expansion and contraction of the metal by the action of heat and cold from affecting its movements. The balance-spring of the chronometer is helicoidal, that of the watch spiral. The pocket-chronometer does not differ in appearance from a watch, except that it is somewhat larger.

3. An instrument intended to set the pace and rhythm for a piece of music; a metronome.—**Solar chronometer**, a sun-dial adapted to show solar time.

Chronoscope (kron'ō-skōp), *n.* [= *F. chronoscope* = *It. cronoscopo*, < *Gr. χρόνος*, time, + *σκοπεῖν*, observe.] 1. An instrument for measuring extremely short intervals of time. Specifically—2. An instrument for measuring the velocity of projectiles. The most general arrangement consists of a series of screens through which a ball is made to pass, the rupture of each screen breaking for a moment the continuity of an electric current, setting in action an electromagnetic machine, and making a permanent mark or record.—**Hipp's chronoscope**, a time-measuring instrument consisting of a train of wheels, moved by a weight, with two dials having hands the wheelwork moving which is thrown in and out of gear with the main train by the action of a clutch worked by an electromagnet. The hands, at first stationary, are thrown into gear by the initial event of the period to be measured, and move until, at the final event, they are thrown out of gear and arrested by the clutch. The distance which they have traveled over the dials measures the interval between the two events.

Cf. *L. aurilia*, *chrysalis*, < *aurum*, gold.] A form which butterflies, moths, and most other insects assume when they abandon the larval or caterpillar state and before they arrive at their winged or per-

foot state; specifically, the pupa of a butterfly. In the chrysalis form the animal is in a state of rest or insensibility, and exists without nutriment for a length of time varying with the species and season. During this period an elaboration is going on in the interior of the chrysalis, giving to the organs of the future animal their proper development before it breaks its envelop.

The form of the case of the chrysalis varies with different families and orders. Those of most lepidopterous insects are enclosed in a somewhat horny membranous case, and generally of a more or less angular form, pointed at the abdominal end and sometimes at both ends. Before the caterpillar undergoes its transformation into this state it often spins for itself a silken cocoon, within which the chrysalis is concealed. In most of the *Coleoptera* the legs of the chrysalis are in distinct sheaths; in the *Lepidoptera* they are not distinct; in the locust tribe, and many other insects, the chrysalis resembles the perfect insect, and differs from the latter principally in not having the wings complete. Also called *chrysalid*, *chrysalidan*, *nymph*, *pupa*, and formerly *auréla*.

'golden flower,' *< χρυσός, gold, + άνθεμον*, flower.] 1. A plant of the genus *Chrysanthemum*.—2. [*cap.*] [*NL.*] A large genus of composite plants, chiefly natives of Europe, Asia, and northern Africa. The generic name is now rarely appropriate, as only a small number have yellow flowers. It ranks as the national flower of

Chrysanthemum frutescens.

Japan, where special attention is paid to its cultivation and variation, and where an open 16-petaled chrysanthemum is the imperial emblem. Several other species are frequently cultivated for ornament, as *C. frutescens*, *C. roseum*, etc. The genus includes the common feverfew (*C. Such a statue was built up upon a wooden core or frame, braced and sustained by rods of metal. When the sculptor had completed his model, the flesh-surface of a cast taken from it was marked off into sections. These were separated from one another, and reproduced in ivory plates, which were eventually fastened on or fitted into the surface of the wooden core. The draperies also were divided into sections and reproduced in gold, gold of different tints often being introduced, and were fitted upon the statue like a garment. The gold por-

tions were sometimes made removable, as in the great statue of Athena by Phidias in the Parthenon at Athens; in that case they were regarded as a reserve fund available to the state in time of need.

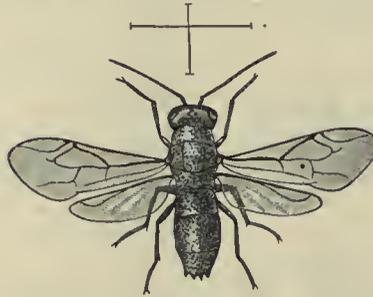

The proportions of the whole building [the Parthenon] itself were again adjusted to the scale of the chryselephantine statue of Pallas Athena which it contained.

chrysene (kris'ēn), *n.* [*< Gr. χρυσός, gold, + -ene.*] A hydrocarbon ($C_{18}H_{12}$) found in coal-tar. It melts at 482° F., and is only slightly soluble in alcohol, ether, and carbon disulphid. It crystallizes in leaflets which have a violet fluorescence.

chrysid (kris'id), *n.* One of the *Chrysididae*.

Chrysididae (kri-sid'i-dē), *n. pl.* [*NL.*, *< Chrysis + -idae.*] A family of tubuliferous hyme-

nopterous insects, having the posterior abdominal segments retractile and the under side of the abdomen concave, and provided with a tubular membranous ovipositor of a single piece. They are richly colored insects, very active in the hottest sunshine, and capable of rolling themselves up into a ball. They are solitary and parasitic, depositing their eggs in the nests of other *Hymenoptera*, especially of the fossorial wasps. There are several genera and many species.

Its fruit is edible, resembling a plum, and is used as a preserve. The wood is heavy, hard, and strong.

chrysoberyl (kris'ō-ber-il), *n.* [*< L. chrysoberyllus*, *< Gr. χρυσοβήρυλλος*, beryl with a tinge of gold color, *< χρυσός, gold, + βήρυλλος*, beryl.] A mineral of a yellowish-green to emerald-green color, sometimes red by transmitted light, an aluminate of glucinum. It is found in rolled pebbles in Brazil and Ceylon; in fine crystals (variety alexandrite) in the Ural; and in granite at Haddam, Connecticut, and elsewhere in the United States. It is next to the sapphire in hardness, and some varieties are employed in jewelry, the kind called *cat's-eye*, which presents an opalescent play of light, being especially admired. The variety alexandrite, having an emerald-green color by reflected and a columbine-red by transmitted light, is also prized as a gem. Also called *cymophane*.

Acts vii. 38.

[What constitutes a Christian church according to the Scriptures is a question on which Christian denominations widely differ. The three principal views may be distinguished as the Roman Catholic, the Protestant ecclesiastical, and the voluntary. According to Roman Catholic theologians, the church is a visible and organic body, divinely constituted, possessing "Unity, Visibility, Indefectibility, Succession from the Apostles, Universality, and Sanctity" (Faith of Catholics, I, 9), and united to its visible head on earth, the Bishop of Rome. According to the Anglican and Protestant ecclesiastical view, the church of Christ is "a permanent visible society" (*Wordsworth* on Mat. xvi. 18), divinely compacted, governed, and equipped, sad having definite ends, a definite policy, and a historic continuity. (The Church Cyc.) According to the voluntary conception, a church is a society of persons professing faith in the Lord Jesus Christ as the Son of God and the Saviour of men, and organized in allegiance to him for Christian work and worship, including the administration of the sacraments which he has appointed. (*R. W. Dale*, *Manual of Congr. Principles*, Comp. West. Conf., xxxv; *Thirty-nine Art.*, xix.) The Church of England claims continuity with that branch of the Catholic Church which existed in England before the Reformation. In the first half of the sixteenth century, under Henry VIII., the spiritual supremacy and jurisdiction of the Pope were abolished; the sovereign was declared to be the head of the church in a sense explained in the thirty-seventh of the Thirty-nine Articles; and a close union of church and state, known as the establishment of the church, took place. The clergy of the Church of England are composed of three orders, namely, bishops, who are appointed by the crown (see *congé d'élire*, under *congé*), priests or presbyters, and deacons. There are also two archbishops, the Archbishop of Canterbury and the Archbishop of York, the former being the primate of England. ciclatoni, ciclatoun, n. [In Spenser, after Chaucer, *cheklaton*, *sheeklaton*, *scheeklaton*; ME. *ecelaton*, *ecelaton*, *ecelaton*, *ecelaton*, *sykelatoun*, *sykelatoun*, once *chekelaton*, < OF. *cielaton*, *cielaton*, *chielaton*, *cielaton*, *siglaton*, *singlaton*, *senclaton*, *segleton* (> Sp. *cielaton*), a kind of mantle or robe, also, at least in AF. (as alone in ME.), a rich fabric (see def.), appar. (with suffix *-on*) (= Sp. *ciclada*, a kind of mantle) < ML. *cyclas* (acc. *cycladem*), *ciclas*, *ciclade*, *ciclades*, *cicladis*, a kind of mantle, also a rich fabric (see def.), < L. *cyclas*, acc. *cyclada* (in Propertius), < Gr. *κύκλας*, a mantle worn chiefly by women, adorned with a border of purple or gold, with ref. to which, or to its circular form (cf. E. *circular*, a cloak), it received its name, < Gr. *κύκλος*, round, circular, < *κύκλος*, round: see *cyclas* and *cycle*. The transfer and enrichment of the sense (from 'a round mantle' to 'a costly fabric of diverse use') is remarkable, and, with the peculiar forms, gives some color to the supposition that

with the L. *cyclas*, etc., in its proper sense of 'a mantle,' has been merged another word, perhaps of Eastern origin, meaning 'a fabric.' Yule compares the Panjāb trade-name *suklāt*, broadcloth, or the Ar. *Sikilyat*, Sicily.] 1. A costly fabric used in the middle ages for men's and women's robes or mantles, and also for leggings, housings, banners, tents, etc. It was sometimes, perhaps generally, of silk, often woven with gold; it is found explained as *pannus aureus*, cloth of gold. From the diversity of its use, the term seems to have been applied to any rich-looking fabric.

Of Brugges were his hosen brown,
His robe was of *ciclatoun*,
That coste many a jane.
Chaucer, *Sir Thopas*, l. 23.

Ther was many gonfalon
Of gold, sendel, and *siclatoun*.

Was the emperours pavylloun.
Rich. Coer de Lion (Weber's *Metr. Rom.*, II. 90).

2. A mantle or robe worn by men and women, apparently of the fabric called by the same name. [But this sense belongs properly only to the French and Spanish *ciclaton* and the Middle Latin *cyclas*; it is not established in English. The word is erroneously explained and used in the following passages by Spenser:

The quilted leather Jacke is old English; for it was the proper weede of the horseman, as ye may reade in Chaucer, where he describeth Sir Thopas his apparrell and armour, when he went to fight agaynst the Gyant, in his robe of *scheeklaton*, which *scheeklaton* is that kind of gilded leather with which they used to embroder theyr Irish jacks.
Spenser, *State of Ireland*.

But in a Jacket, quilted richly rare
Upon *cheklaton*, he was strangely dight.
Spenser, *F. Q.*, VI. vii. 43.]

Ciliata (sil-i-â'tä), *n. pl.* [NL., neut. pl. of *ciliatus*, having cilia: see *ciliate*.] 1. The ciliated infusorians; a major group of *Infusoria*, as distinguished from the *Flagellata* and the *Tentaculifera*, characterized by the possession of organs of locomotion and prehension in the shape of numerous vibratile cilia, more or less completely clothing the body. The cilia are variously modified as setæ, styles, or uncini, and membraniform expansions are occasionally found; but the *Ciliata* are devoid of the special supplementary lash-like appendages called flagella. They are usually unsymmetrical animals of a high grade of organization in their class, the simplest of them being differentiated into an endosarc and ectosarc with an endoplasmic and contractile vacuole, while most, if not all, show an oral region where food is ingested, whence an esophageal depression leads into the endosarc; and there is also, usually, an aboral or anal area through which the refuse of digestion is evacuated. The families are numerous, and have been divided by Stein into the groups *Holotricha*, *Heterotricha*, *Hypotricha*, and *Peritricha*, according to the character of the cilia and their disposition upon the body of the animal. *Paramecium* and *Vorticella* are common examples of the *Ciliata*.

Now usually and more accurately called *flagellated chambers*. See *Leucos*, and cuts under *Porifera* and *Spongilla*. —**Ciliated groove**, in ascidians, a grooved region of the body connected with a nerve-center and provided with flagella, supposed to be a sense-organ, probably olfactory. —**Ciliated infusorians**, the *Ciliata*. —**Ciliated tracts**, in ascidians, clefts beset with cilia, situated about the entrance to the respiratory chamber, and leading thence to the esophagus or the vicinity of the great nervous ganglion, or ending in the ciliated groove (which see, above). = *Syn. In such cases the cilia have in the individual

cells precisely the same action as in the numberless microscopic animals of which they are highly characteristic, as infusorians, radiolarians, polyzoans, rotifers, and the embryonic or larval stages of very many other invertebrates. Cilia are distinguished by their permanency from the various temporary processes which resemble them, such as pseudopodia, and by their minuteness and activity from the similar but usually larger special processes known as flagella, vibracula, etc.; but the distinction is not absolute. The peculiar vibratile action of cilia is termed *ciliary motion*. See *cuts under blastocoele, Paramecium, and Vorticella*.

The NL. name according to the Sp. would prop. be *Chinchona* (pron. chin-chō'nä), but it rarely appears in that form, being adapted in form and pron. to L. analogies.] 1. A genus of evergreen trees, natural order *Rubiaceae*, natives of the Andes from the United States of Colombia to Bolivia, growing chiefly on the eastern slopes at an average altitude of from 5,000 to 8,000 feet. They are the source of Peruvian or cinchona bark and of quinine. There are about 40 species, but the cinchona barks of commerce are produced by about a dozen. The barks used in pharmacy are chiefly of three kinds: *loxa*, crown, or pale cinchona bark, the ordinary Peruvian bark, afforded by *C. officinalis*; *calisaya* or

bian or *Cartagena* bark, from *C. lancifolia* and *C. cordifolia*; *Pitayo* bark, from *C. Pitayensis*; gray, Lima, or *Huamaco* bark, from *C. Peruviana* and other species; and *Cusco* bark, from *C. pubescens*. The British and Dutch governments have done much to promote the cultivation of the more important species, and extensive plantations have been successfully established in the Himalayas and in Ceylon, Java, and Jamaica. Cinchona bark is most valuable as a remedy in fevers and as a general tonic; but the alkaloids obtainable from the bark have in practice largely taken the place of the bark itself. Of these the most abundant and the one in most common use is quinine. Others equally valuable are quinadin, cinchonine, and cinchonidine. The amount of alkaloids yielded by the bark is very variable, from a very small percentage to as much as 12 per cent., of which from one third to three fourths is quinine. 2. 1. The act of circulating or moving in a circle

or circuit; movement in such a manner as to go forth and return to the starting-point: as, the *circulation* of the blood (see phrases below).—**2.** The act or state of being diffused or distributed; the act of passing from point to point or from person to person; diffusion: as, the *circulation* of sap in a tree; the *circulation* of money; the *circulation* of a piece of news.

5. The amount of coin, notes, bills, etc., in actual use as currency: as, the *circulation* of the national banks.

It comes with something solid in aid of the credit of the paper *circulation*. *Burke*.

6. In *chem.*, the repeated vaporization and condensation of a substance in distillation.—**7.** In *math.*, the amount of flow round a closed path or circuit; the line-integral round a closed curve of the component velocity of a fluid along the curve.—**Circulation of the blood**, the passage of the blood from the heart into the arteries, from them into the veins, and through the veins back to the heart. The blood passes from the right auricle to the right ventricle, and from the right ventricle by the pulmonary artery to the capillaries of the lungs, where it gives off carbon dioxide and takes up oxygen. From the capillaries of the lungs it returns to the heart, and flows into the left auricle through the four pulmonary veins; thence it goes to the left ventricle, and thence by the aorta to distribute itself over the body. Passing from the arteries through the capillaries into the veins, it returns to the right auricle through the superior and inferior vena cava. The blood-vessels form a continuous system without visible pores; but there is continual leakage of the blood-plasma into the tissues, as well as passage of oxygen through the walls of the vessels; and while there is some reentrance of substances from the tissues into the blood, there is also provided in the lymphatic vessels a system of drains which takes up from the tissues the leakage from the blood-vessels, changed as it is by all that it has received from and given up to the tissues. These lymphatics pour their contents into the thoracic duct, which discharges into the veins at the union of the veins from the head and neck on the left side; except that the lymphatics from the right side of the head and the right arm and shoulder empty into the veins at the corresponding point on the right side. The velocity of the circulation is greatest as it leaves the heart, diminishes as it proceeds to the capillaries, and increases as it comes back to the heart again in the great veins. It is estimated as from 15 to 20 inches per second in the aorta, on the average, and in the capillaries as .02 to .03 of an inch per second. The time for the complete circuit in man is a little less than half a minute. The tension of the blood in the human aorta is probably between 5.90 and 7.87 inches of mercury above the atmospheric pressure. It diminishes continuously in the arteries, capillaries, and veins, and in the large venous trunks near the heart, as the subclavian, becomes slightly less than the atmospheric pressure, and is called *negative*. The circulation of the blood was first correctly described and fully established by Harvey (1628); but the exact way in which the blood passed from the arteries to the veins was unknown until Malpighi discovered the capillaries (1661). In the mean time the main features of the lymphatic system had been worked out by Bartholin and others. The determination of blood pressures and velocities and the functions of the vasomotor nerves has been the work almost entirely of the present century.—**Collateral circulation**, in *physiol.*, the passage of the blood from one part to another of the same system of vessels by collateral communicating channels. It is much more frequent in the veins than in the arteries.

6. In *chem.*, the repeated vaporization and condensation of a substance in distillation.—**7.** In *math.*, the amount of flow round a closed path or circuit; the line-integral round a closed curve of the component velocity of a fluid along the curve.—**Circulation of the blood**, the passage of the blood from the heart into the arteries, from them into the veins, and through the veins back to the heart. The blood passes from the right auricle to the right ventricle, and from the right ventricle by the pulmonary artery to the capillaries of the lungs, where it gives off carbon dioxide and takes up oxygen. From the capillaries of the lungs it returns to the heart, and flows into the left auricle through the four pulmonary veins; thence it goes to the left ventricle, and thence by the aorta to distribute itself over the body. Passing from the arteries through the capillaries into the veins, it returns to the right auricle through the superior and inferior vena cava. The blood-vessels form a continuous system without visible pores; but there is continual leakage of the blood-plasma into the tissues, as well as passage of oxygen through the walls of the vessels; and while there is some reentrance of substances from the tissues into the blood, there is also provided in the lymphatic vessels a system of drains which takes up from the tissues the leakage from the blood-vessels, changed as it is by all that it has received from and given up to the tissues. These lymphatics pour their contents into the thoracic duct, which discharges into the veins at the union of the veins from the head and neck on the left side; except that the lymphatics from the right side of the head and the right arm and shoulder empty into the veins at the corresponding point on the right side. The velocity of the circulation is greatest as it leaves the heart, diminishes as it proceeds to the capillaries, and increases as it comes back to the heart again in the great veins. It is estimated as from 15 to 20 inches per second in the aorta, on the average, and in the capillaries as .02 to .03 of an inch per second. The time for the complete circuit in man is a little less than half a minute. The tension of the blood in the human aorta is probably between 5.90 and 7.87 inches of mercury above the atmospheric pressure. It diminishes continuously in the arteries, capillaries, and veins, and in the large venous trunks near the heart, as the subclavian, becomes slightly less than the atmospheric pressure, and is called *negative*. The circulation of the blood was first correctly described and fully established by Harvey (1628); but the exact way in which the blood passed from the arteries to the veins was unknown until Malpighi discovered the capillaries (1661). In the mean time the main features of the lymphatic system had been worked out by Bartholin and others. The determination of blood pressures and velocities and the functions of the vasomotor nerves has been the work almost entirely of the present century.—**Collateral circulation**, in *physiol.*, the passage of the blood from one part to another of the same system of vessels by collateral communicating channels. It is much more frequent in the veins than in the arteries.

5. A private person, as opposed to a civil official or a soldier: as, a police officer in *citizen's dress*.—**Natural-born citizen**, one who is a member of a state or nation by virtue of birth. The English courts, while holding that a child born within the allegiance and jurisdiction is a natural-born British subject irrespective of alien parentage, held also, after much conflict of opinion, and in disregard of abstract consistency, that a child born in a foreign country of British parents was also a natural-born British subject. The American rule is that a child born and remaining within the exclusive jurisdiction of the United States is a citizen, and within its allegiance and protection, irrespective of the birth or nationality of its parents.—**Naturalized citizen**, one of foreign birth who has become a citizen by adoption or naturalization, as distinguished from a native-born or natural-born citizen.

In Great Britain the term is applied in a narrower sense to a town corporate which is or has been the seat of a bishop and of a cathedral church. The only free cities remaining are Hamburg, Lübeck, and Bremen, which since 1871 have been sovereign members of the present German empire. The clan is a tribal form of social and political organization based upon kinship of the members. The chief features of the system are (1) the leadership of a chief, regarded as representing a common ancestor, and (2) the possession of land partly undivided as the common domain of the clan, and partly divided as the separate property of its members and their heirs, the clan being the heir of a member who dies leaving no son. It prevailed in early times in Germany and Ireland, and until recently in Scotland, and to some extent in other countries. Thus, among the Highlanders a clan consisted of the common descendants of the same progenitor, under the patriarchal control of a chief, who represented the common ancestor, and who was revered and served by the clansmen with the blind devotion of children. The clans did not, however, acknowledge the principle of primogeniture, often raising to the chieftainship a brother or an uncle of a deceased chief. The name of the clan was generally that of the original progenitor with the prefix *Mac* (son). There are few traces of this institution now remaining.

Each trained to arms since life began,
Owning no tie but to his clan.
